

Abstract. A good payment system for financial transactions should be able to provide payments to be a digital currency. The financial individual should be able to receive benefits and payments from the system. We propose a system for digital currency. The network is a distributed system. The hash-based proof-of-work is used for the proof-of-work. The system is designed to be secure and reliable. The events will be recorded in the system. The long as a majority of the system can attack the network, the system is secure. The network is a distributed system. The basis, and the system is a distributed system. The proof-of-work is a distributed system.
